# Click It, Stack It!

## Start here: printing and stringing your name clicker keychain

### What's in your download

| | |
|---|---|
| **3MF** folder | Plates for Bambu Studio / OrcaSlicer: **Keycaps-A-Z**, **Keycaps-0-9**, **Keycap-BLANK**, **Blocks-x10**, **Fit-Test**. |
| **STL** folder | One file per keycap, one block, and the fit test, for any slicer. |
| **LICENSE.txt** | Your commercial licence (page 3). |

### You'll also need (not included)

One **MX-style switch** per letter (any keyboard switch with a + stem), **4 mm (550) paracord** and a keyring.

### Sizes

Block 28 × 30 × 17 mm, two cord tunnels. Keycap 21.2 mm, letters 13 mm. Each letter adds about **28 mm** to the keychain.

# Print blocks and caps

1. **Print the fit test first** (**Fit-Test.3mf**, about 25 min): one block and one cap. Check that your paracord slides through both tunnels and that a switch and cap press in snugly.
2. **Blocks: Blocks-x10.3mf** prints 10 blocks in one colour (about 2 h, 58 g). Print several colours for a rainbow mix.
3. **Keycaps: Keycaps-A-Z.3mf** (about 1 h 45 min, 45 g) and **Keycaps-0-9.3mf**. Two colours with **one** filament change: the letter is the top 1 mm. Only need some letters? Delete the others, or copy-paste letters you need twice.
4. **Different cap colours?** In your slicer, change filament 1 (cap) and 2 (letter) to any colour, or print the STL caps one colour at a time.

Times and weights: Bambu Studio 2.8 estimates, Bambu Lab A1, 0.20 mm layers.

## Suggested settings

| Setting | Value |
|---|---|
| **Orientation** | As the files open: blocks open side up, caps upright |
| **Supports** | Off. The tunnels have pointed roofs that print by themselves. |
| **Layer height** | 0.20 mm |
| **Walls / infill** | 3 walls, 15–20 % |
| **Material** | PLA |

One block, cap and two cords.

# Put it together

1. Fold about **60 cm of paracord** in half through a keyring and tie a knot below the ring (a snake knot looks great).
2. Snap an **MX switch** into each block, then press a **keycap** onto each switch.
3. Thread **one strand through each tunnel** of the first letter's block. Add the rest of the name in order, then tie a knot under the last block to hold the stack tight.

### Commercial licence: you may

✔ Print and sell unlimited clickers, online and in person ✔ Personalise names for customers, any colours ✔ Use photos of your own prints

### You may not

✘ Share, resell or upload the files (STL, 3MF) or this guide ✘ Claim the design as yours ✘ Use our listing photos. One licence per shop.

### Cord is tight in the tunnel?

Melt and squeeze the cut end to a point, or wrap it in tape. Your printer's flow may also make holes a little smaller: check with the fit test.
